Weekly Coal Production

Production for Week Ended:
January 12, 1991

WEEKLY COAL PRODUCTION
FOR THE WEEK ENDED
JANUARY 12, 1991

JAN 12 1991

Preface

The *Weekly Coal Production* (WCP) provides weekly estimates of U.S. coal production by State. Supplementary data are usually published monthly in two supplements: the Coal Exports and Imports Supplement and the Domestic Market Supplement. The Coal Exports and Imports Supplement contains detailed monthly data on U.S. coal and coke exports and imports. The Domestic Market Supplement contains detailed monthly electric utility coal statistics, by Census Division and State, for generation, consumption, stocks, receipts, sulfur content, prices, and the origin and destination of coal shipments. This supplement also contains summary-level, monthly data for all coal-consuming sectors on a quarterly basis.

Preliminary coal production data are published quarterly, based on production data collected using Form EIA-6, "Coal Distribution Report." Based on 1988 and 1989 data, the coal production estimation error for a quarter at the national level (i.e., the difference between the sum of the weekly estimates for a quarter and the quarterly EIA-6 preliminary data) ranges from 1 percent to 4 percent for 1988 and 1 percent to 2 percent for 1989.

Final coal production data are published annually, based on the EIA-7A coal production survey. Based on 1988 and 1989 data, the revision error for a quarter at the national level (i.e., the difference between the EIA-6 preliminary data and the EIA-7A final data) ranges from 0.02 percent to 0.08 percent for 1988 and 0.9 percent to 0.14 percent for 1989.

This publication is prepared by the Coal Division; Office of Coal, Nuclear, Electric and Alternate Fuels; Energy Information Administration (EIA) to fulfill its data collection and dissemination responsibilities as specified in the Federal Energy Administration Act of 1974 (P.L. 93-275) as amended. *Weekly Coal Production* is intended for use by industry, press, State and local governments, and consumers. Other publications that may be of interest are the quarterly *Coal Distribution*, the *Quarterly Coal Report*, *Coal Production 1989*, and *Coal Data: A Reference*.

This publication was prepared by Wayne M. Watson and Michelle D. Bowles under the direction of Mary K. Paull and Noel C. Balthasar, Chief, Data Systems Branch. *Questions on energy statistics should be directed to the National Energy Information Center (NEIC) at 202/586-8800.*

Summary

This *Weekly Coal Production (WCP)* report contains U.S. coal production estimates for the week ended January 12, 1991; December 1990 coal production estimates by State; and a summary of 1990 preliminary production estimates, by month, for each coal-producing State. Revisions to monthly State production data for the third quarter of 1990 are reflected in the summary tables.

U.S. coal production in the week ended January 12, 1991, as estimated by the Energy Information Administration, totaled 19 million short tons. This was 30 percent higher than in the previous week, which included the New Year's Day holiday, and 7 percent lower than in the comparable week in 1990.

Production east of the Mississippi River totaled 11 million short tons, and production west of the Mississippi River totaled 8 million short tons.

Preliminary 1990 Production

Coal production in 1990, as estimated by the Energy Information Administration, reached a record level of 1.036 billion short tons, 55 million short tons above the 1989 level. For the third consecutive year, Wyoming was the top coal-producing State, followed by Kentucky and West Virginia. Nine States reached record levels of production in 1990: Alabama, Indiana, Kentucky, Louisiana, North Dakota, Texas, Utah, Virginia, and Wyoming.

The principal reason for the increased output in 1990 was the demand by electric utilities to build up coal stocks and to meet higher coal consumption requirements. To a lesser extent, production also rose in response to a higher demand for exports of steam coal to European markets.

Most of the increase in national coal production occurred east of the Mississippi River, where coal production (including anthracite) reached a record level of 635 million short tons, 36 million short tons more than in 1989. West Virginia and Virginia registered the largest production gains. West Virginia coal production was up primarily to meet an increase in exports overseas and, to a smaller extent, to Canada. Also contributing to the increase was a build-up of electric utility coal stocks in West Virginia and Maryland. The increase in Virginia coal production was fueled by additional coal exports overseas.

Coal production west of the Mississippi River, which also rose to a record level, was 401 million short tons, 20 million short tons above the 1989 level. Wyoming accounted for the major portion of the increase in Western production. Wyoming coal output was up by 14 million short tons, primarily in response to higher electric utility demand in Indiana.
